Program Overview

This program is a lexical analyzer written in Python, which reads arithmetic expressions from a file and classifies each token into categories such as:

- Numbers
 - Integer
 - Float
 - Scientific notation
- Operator (=, +, -, *, /, ^)
- Identifiers (variables)
- Special symbols
- Comments

It uses Deterministic Finite Automata DFA basis for classification.

How to run the program

Requirements:

- Python 3.x installed
- The program file: final.py
- Input file: expressions.txt

Install Required Libraries:

- Python standard libraries are used

Run the Program

Open a terminal and navigate to the folder containing both files.

- Run the script with:

```
python final.py
```

Input Format

The input should be placed in a file named `expressions.txt`

Output Format

The program prints the results to the console.

Each line of output has two columns:

Token - the substring from the expression

Type - the classification of the token

Numbers

Integer
